and bonds. The exchange rate of the HUF (which was responsible for the big drop in the Funds NAVPU in March) was also stable, it moved more or less parallel to the foreign currencies of the developing markets. The composition of the portfolio got seriously altered. According to the macroeconomic and political news we revalored the South African situation, and we decided a significant weight lowering. We also sold some part of the Icelandic portfolio, since the Icelandic krona is still weak, and we don't see the signs of a strengthening. We reallocated these amounts in Hungarian government securities and Turkish government securities. These markets offered very tempting entrance points according to the yield levels and the currency exchange rates. In contempt of the big NAVPU drops in February and March, we think that the time is more than right to invest into the Fund! The long term outlook for the developing markets is very tempting and we expect the emerging markets to overperform the yields of the domestic bond market.

Investment Policy of the Fund:

The AEGON Fund Management Co. launched the AEGON EMMA Emerging Markets Bond Fund, so potential investors could profit from the high-yield environment of those developing countries in which the fund invests. Although these countries are developing ones, but their macroeconomic background is stable, and they are on a growth path. The anticipatory yield of the Fund is higher than the yield of a domestic bond fund, but the risk is also a bit bigger. A high yield, or "junk bond" is a bond issued by a country or a company that is considered to have higher credit risks. The credit rating of a high yield bond is considered "speculative grade", or below "investment grade". This means that the chance of default with high yield bonds is higher than for other bonds. Their higher credit risk means that "junk bond" yields are higher than bonds of better credit quality. Studies have demonstrated that portfolios of high yield bonds have higher returns than other bond portfolios, suggesting that the higher yields more than compensate for their additional default risk. The investment possibilities of the Fund are very wide, so the portfolio manager has a wide-spread financial leeway to build up an optimal portfolio. We target the utmost yield by taking the lowest risk. By taking investment decisions we use fundamental and technical analysis, and we certainly keep an eye on the market sentiment as well. Our investment decisions are supported by a special investment-planning model, which is filled up with all the important macroeconomical data and indicators, like the anticipated level of inflation in these countries, their GDP growth, their credit ratings and so on. The portfolio manager generates a so-called risk - yield map, by focusing on the anticipated macroeconomic environment, the anticipated yield curve, and the above-mentioned model. When the map is ready, those risk-yield pairs will be chosen out which are considered to be safe and offer relative high yield at the same time.
