| Total investment assets    | 100.00% |
| Net corrected leverage     | 24.02%  |
| Derivative products        | 0.00%   |

## Investment Policy of the Fund:

The goal of the fund is to buy investment assets that are very undervalued according to various economical/market factors. The fund concentrates on so called distressed assets that became rather cheap because of some explosion of psychological panic in the markets. The Fund is allowed to take long positions and open uncovered short positions on such assets that became extraordinary expensive in market euphoria. The position taking in very over/undervalued assets is usually unprofitable in short-term, but on the other hand it could get very rewarding in long-term. The fund doesn't use stop-loss orders, since it hasn't got a commercial approach, so the volatility of the NAVPU can get pretty high. To lower the volatility, the portfolio manager pays big attention to the size, mix and correlation of the positions. The investment policy of the fund isn't trend following, but it is contrarian. A contrarian believes that certain crowd behavior among investors can lead to exploitable mispricings in securities markets. For example, widespread pessimism about a stock can drive a price so low that it overstates the company's risks, and understates its prospects for returning to profitability. Identifying and purchasing such distressed stocks, and selling them after the company recovers, can lead to above-average gains. Similarly, widespread optimism can result in unjustifiably high valuations that will eventually lead to drops, when those high expectations don't pan out. Avoiding investments in over-hyped investments reduces the risk of such drops. These general principles can apply whether the investment in question is an individual stock, an industry sector, or an entire market or asset class. The Fund mainly invests into equities, bonds, money market indexes, commodities, currencies, but the investment possibilities of the fund are extremely wide, and it can invest into any kind of capital market instrument. The fund is allowed to use leverage by investing into derivatives and futures. Leverage has the potential to enlarge profits or losses by the same magnitude. The greater the amount of leverage on capital you apply, the higher the risk that you will assume. The fund's benchmark index is the RMAX index. The main goal of the portfolio manager is to over perform the benchmark yearly by 5%-10%.

  high

## Market Summary:

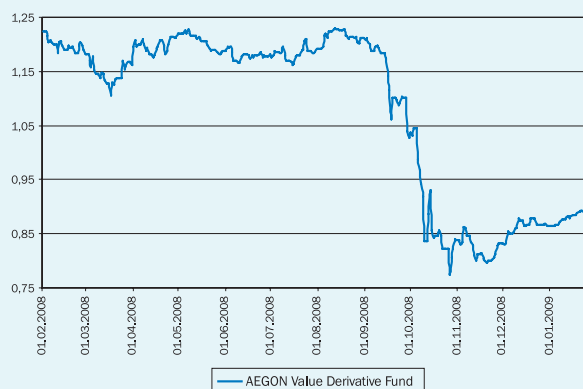

The performance of the AEGON Value Derivative Fund in January was satisfactory. The Fund managed to gain 2.71% during the month. The Hungarian bond portfolio within the fund is only 2.5 year long. The fund is holding some high yield corporate bonds as well. The fundamental value investment was not successful in this extreme environment. In the meantime we believe that the risk taking will come back and the investors will find the most profitable companies, so the share prices will increase and only the non-profitable companies will go bankrupt. In this upcoming environment, if the portfolio manager succeeds to pick the best companies that can generate a decent yield for the investors. The fund is trying to make profit from the increasing share prices but it will open bigger positions only if it is obvious that this trend has started.

## NET Yield Performance of the Fund:

| Time horizon            | 12 months* | 2008 year | 2007 year |
|-------------------------|------------|-----------|-----------|
| Net return of the Fund* | -26.37%    | -27.40%   | 6.57%     |
| Benchmark performance** | 6.50%      | 6.70%     | 5.92%     |

\* It shows the net performance of the fund until 31/01/09  
 The Fund was launched on 13/02/06  
 \*\* The net return of the benchmark index.
