

## INVESTMENT POLICY OF THE FUND

The objective of the fund is to get a share of the yields of the Russian equity market, and to benefit on the Russian economy growth through equity rates and dividends incomes. In accordance with the risk features of the equity investments, the fund is considered as a high-risk investment. According to the intentions of the Fund Manager, the portfolio of the Fund is predominantly formed by equities publicly issued by foreign companies. Primary targets of investment are the equities of companies listed on the stock that operate in Russia or countries of the former Community of Independent States or make most of their revenues in those countries. When establishing the portfolio, the equities determine the nature of the fund, so the ratio of equities in the fund may reach the legal maximum at the time. The fund registers its assets in Hungarian Forint. The Fund Manager is entitled to cover part of all the currency risks with forward currency positions, while complying with the effective legal provisions.

## MARKET SUMMARY

In January, investors almost completely forgot about what has been weighing on their investment decisions over the past two years. It seems that the Omicron variant of the Covid virus, although spreading much faster, has a much weaker impact on humans than previous variants. The strain on the health infrastructure is not as great and the mortality rate is significantly lower. This was good news, because it meant that investors could finally focus on the things that would affect the long-term course of the economy. It was a cold shower for the markets that after the rate decision meeting in January, Fed Chairman Jay Powell stated in the strongest possible terms that now the Fed's leaders could see that their inflation expectations of last year had not been met, that inflation was significantly higher than they had expected and that they would therefore do everything possible to bring inflation down to the Fed's preferred level in 2022. The chairman outlined a plan that caused panic in the markets. According to these plans, the tapering would be drastically accelerated and interest rates would be raised as early as March. This was not well received by the markets and investors suffered the worst January sell-off ever. The ECB is facing similar problems to the US Federal Reserve. Inflation is already significant factor in Europe, but the ECB is reluctant to raise interest rates. What has been a particular problem over the past month is that energy prices have soared. This is affecting the performance of the economy, but the biggest problem is that the inflation figures remain very high. The Hungarian National Bank continued to raise interest rates in January in response to the high inflation figures. The base rate was increased by 50 basis points to 2.90% while the one-week deposit rate was raised by 30 basis points to 4.30%. The EURHUF exchange rate finally reacted to the continuous rate hikes, falling from 370 to 352.

The fund posted a negative return in January, but outperformed the benchmark index. Our view is that the Russian market has become very underpriced due to geopolitical risks. The fund remains overweight the oil and gas extraction sector. In contrast, technology, gold and internet companies remain underweight. The fund was underweight against the benchmark index at the end of the month.
